## THE GOOD DIAGNOSTICIAN

becomes more than ever puzzled when trying to fit inaccurate metabolism reports in with what his common sense tells him simply can't be true.

He cannot fit a minus report into a hyperthyroid picture, or a plus or normal rate into hypothyroidism.

Technical errors responsible for inaccurate metabolism testing ought to be under the diagnostician's own personal control.

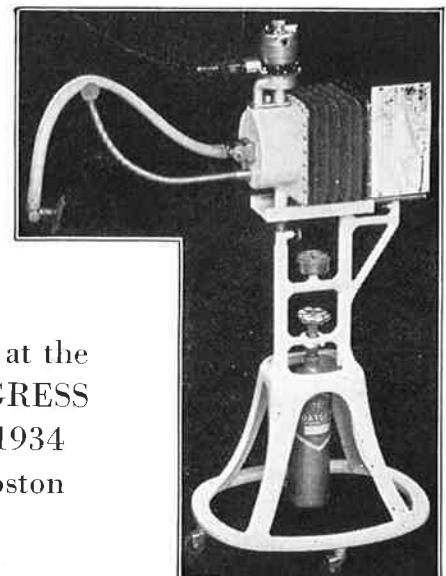

The most satisfactory system is to have the machine in his own office—one which has the exclusive feature by which the tracing itself shows whether or not his technician is giving him a correct report.

### THE NEW JONES MOTOR—

## Basal

is a composite of features exclusively its own. The slide rule here illustrated gives the results instantly and without calculation. All data—for both sexes, from 4 to 80 years, and from 40 to 400 pounds—is contained in the small space of the face of this slide rule device. The machine itself requires no barometer, no thermometer, no table, no counterpoise, no balancing and—best of all—no water.

It eliminates all these things and yet guarantees greater accuracy—accuracy greater than 99% and sells under a life guarantee.
